Introduction

Sepsis is the body's toxic response to infection, and is preventable and treatable when identified early, and treatment is not delayed. Sepsis is the number one cost during hospitalization and leading cause of death in hospitals across the United States. By implementing bundles/protocols, clinical staff can identify sepsis early, and implement treatment before severe illness occurs (The Sepsis Alliance, 2024)

T.I.M.E

- Temperature
- Infection
- Mental Decline
- Extremely Ill

Objectives

1. Identify signs and symptoms of possible sepsis
2. Analyze the steps to completing the Hour One bundle when sepsis is suspected
3. Discuss interventions used when sepsis is identified

Methods

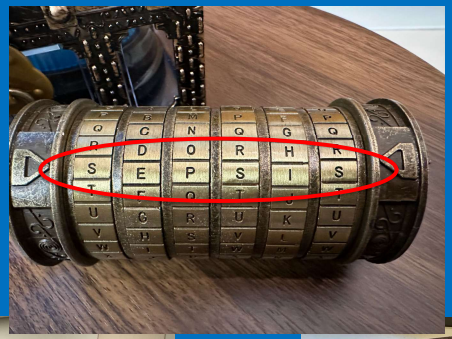

Escape rooms have been proven to be an effective teaching modality in medical education, and has been found to improve engagement amongst learners. A brief table top escape game was designed to reinforce the importance of early identification of sepsis, effective provider communication, diagnostics included in the hour one bundle, and interventions that may be implemented at the bedside.

The Game Flow

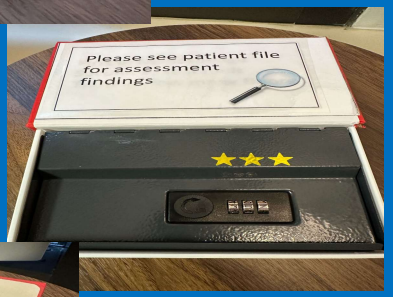

Players start by receiving report from the previous nurse, and discover their patient is showing signs of possible infection. Players must assess their patient, identify the signs of infection, communicate with the provider, facilitate the diagnostics, implement the interventions, and retrieve the antibiotic before time runs out! Can you complete the hour one bundle and save your patient from sepsis?

The Race Against T.I.M.E. : A Sepsis Escape Game

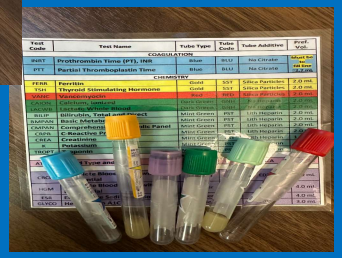

Can't stay to play?????
